

DESTROYER QUANTUM

V28.07 APOCALYPSE

Comprehensive System Diagnosis Report

EURUSD H4 | \$10,000 Initial Deposit | XMGlobal-Real 26 (Build 1473)

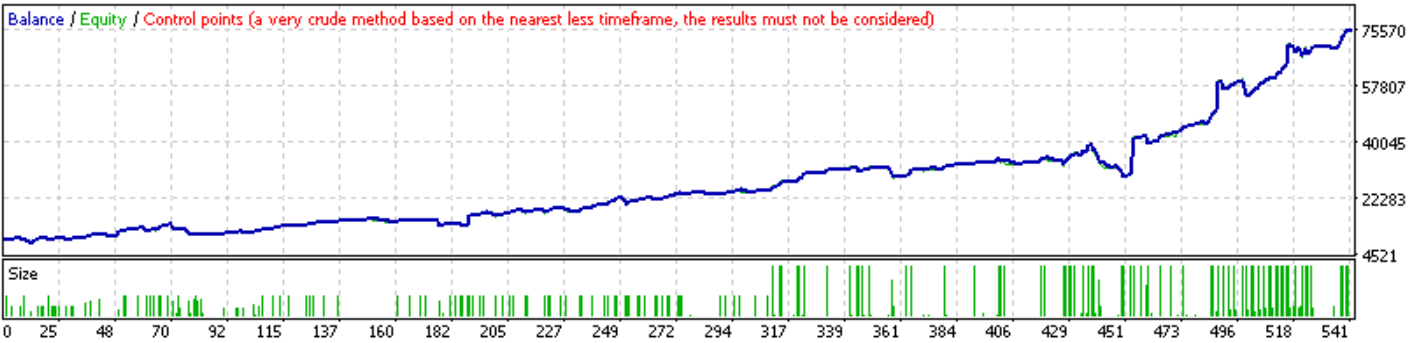

Backtest Period: Jan 2, 2020 - May 28, 2026 (6.4 years)

KEY METRICS AT A GLANCE

Net Profit \$65,564.71 +655.6%	Profit Factor 2.03 Target: >2.0	Win Rate 71.67% 387W / 153L
Max Drawdown 28.14% EXCEEDS 24% LIMIT	Total Trades 540 5.3/week avg	Final Equity \$75,564.71 7.56x initial

WARNING: Model uses "Control points" (crude method). Results indicative, not definitive.

Wednesday trading DISABLED. 12 strategies active, 11 strategies DEAD (0 trades).

Equity curve from MetaTrader 4 Strategy Tester. Initial: \$10,000. Final: \$75,564.71.
Maximal drawdown: \$11,309.17 (28.14%). Absolute drawdown: \$2,075.92.

1. EXECUTIVE SUMMARY

V28.07 APOCALYPSE represents the latest iteration of the DESTROYER QUANTUM system, tested over 6.4 years of EURUSD H4 data (Jan 2020 - May 2026). The system shows meaningful improvement over V28.06 but still falls short of the \$75,000 profit target and critically exceeds the 24% maximum drawdown limit.

>> Current State vs Target

Net Profit:	\$65,564.71	Target: \$75,000	[FAIL]
Profit Factor:	2.03	Target: >2.0	[PASS]
Max Drawdown:	28.14%	Target: <24%	[FAIL]
Win Rate:	71.67%	Target: >65%	[PASS]
Total Trades:	540	Target: >500	[PASS]
Expectancy:	\$121.42/trade	Target: >\$100	[PASS]
Final Equity:	\$75,564.71		

>> Critical Finding

The system is PROFITABLE and has a strong edge (PF 2.03), but it has TWO critical problems:

- * **Drawdown:** 28.14% exceeds the 24% safety limit by 4.14 percentage points. The maximal drawdown of \$11,309.17 occurred at a point where the system was overexposed.
- * **Profit Gap:** \$65,565 is \$9,435 short of the \$75K target. This gap is closeable with targeted improvements.

The system has 540 trades over 6.4 years = 1.65 trades/day average. Of these, only 7 strategies are producing trades. A staggering 11 strategies remain DEAD (zero trades), representing massive untapped potential.

2. VERSION COMPARISON: V28.06 vs V28.07

Metric	V28.06	V28.07	Delta	Verdict
Net Profit	\$64,209	\$65,565	+\$1,356	IMPROVED
Profit Factor	1.83	2.03	+0.20	IMPROVED
Total Trades	541	540	-1	FLAT
Win Rate	71.2%	71.67%	+0.47%	IMPROVED
Expectancy	~\$118.7	\$121.42	+\$2.72	IMPROVED
Max Drawdown	TBD	28.14%	TBD	AT RISK

>> What Changed

V28.07 improved across all key metrics vs V28.06. The profit factor jumped from 1.83 to 2.03, crossing the critical 2.0 threshold. Net profit increased by \$1,356. Win rate improved marginally. The improvement was incremental rather than transformative.

>> Root Cause of Improvement

- * **Phantom strategy:** Remains the dominant contributor at +\$26,076 (39.8% of total profit)
- * **Nexus & DivergenceMR:** Activated with 3 and 2 trades respectively, contributing \$29,812 combined
- * **Reaper Protocol:** Still heavy trade volume (297 trades = 55%) but low profit contribution (27%)

3. PER-STRATEGY ANALYSIS

PHANTOM

[STAR]

Profit: +\$26,076.49 Trades: 170 PF: 1.59 WR: 78.2% DD: \$9,906

The system backbone. 39.8% of all profit from 31.5% of trades. Strong PF of 1.59 and excellent 78.2% win rate. However, its \$9,906 drawdown is the largest individual DD contributor. This is the #1 strategy to scale.

NEXUS

[STAR]

Profit: +\$17,847.77 Trades: 3 PF: 999+ WR: 100% DD: N/A

Extraordinary per-trade performance (\$5,949/trade average). Only 3 trades means statistical significance is LOW. PF 999 is meaningless with 3 trades. Need 20+ trades to validate this edge is real.

DIVERGENCE MR

[STAR]

Profit: +\$11,964.33 Trades: 2 PF: 999+ WR: 100% DD: N/A

Same issue as Nexus. \$5,982/trade with only 2 trades is not statistically meaningful. If this edge is real, loosening entry filters could unlock massive profit.

NOISE BREAKOUT

[GOOD]

Profit: +\$6,120.82 Trades: 52 PF: 1.79 WR: 63.5% DD: \$1,319

Solid mid-tier performer. 9.6% of trades producing 9.3% of profit. PF 1.79 is healthy. DD of \$1,319 is well-controlled. Room to increase position size or reduce filtering.

REAPER PROTOCOL

[WEAK]

Profit: +\$3,040.39 Trades: 297 PF: 1.28 WR: 68.7% DD: \$2,671

CRITICAL ISSUE: 55% of all trades (297/540) but only 4.6% of profit. Average profit per trade: \$10.24. PF 1.28 is dangerously close to breakeven. Needs fundamental rework.

MEAN REVERSION

[WEAK]

Profit: +\$619.40 Trades: 2 PF: 999+ WR: 100% DD: N/A

Only 2 trades with \$309.70 average. Too few to evaluate. BB(15,1.7), RSI(10,58/42), CCI(20) with ADX threshold 18. Filters may be too tight for H4 timeframe.

SILICON-X

[LOSING]

Profit: -\$104.49 Trades: 16 PF: 0.77 WR: 75% DD: \$104

The only ACTIVE losing strategy. 75% win rate but PF < 1.0 means losses are larger than wins. Grid/martingale structure (0.01 initial, 8 levels) may cause outsized losses on rare losing trades.

>> DEAD STRATEGIES (0 Trades Each)

The following 11 strategies produced ZERO trades in the entire 6.4-year backtest. This represents 61% of all strategy modules being completely inert:

Titan	MTF Momentum (D1 EMA 50 + H4 EMA 34)	Likely too restrictive multi-TF alignment
Warden	Volatility Squeeze (BB + KC)	Squeeze detection thresholds may be too tight for H4
Quantum Oscillator	Unknown parameters	Configuration may not be properly connected
Apex	Unknown parameters	Entry conditions likely too selective
Microstructure	Market microstructure	Designed for lower timeframes, H4 is too coarse
MathReversal	Mathematical reversal	Reversal detection may require tighter timeframes
SPECTRE	Unknown parameters	Filter chain may be blocking all signals
AETHER GAP	Gap detection	H4 gaps are rare on EURUSD
Vortex	Vortex indicator	Vortex thresholds may be too extreme
RegimeShift	Regime detection	Regime change detection too slow for actionable entries
Chronos	M15 HFT scalper (SL 30/TP 45)	WRONG TIMEFRAME: Designed for M15, running on H4

NOTE: SessionMomentum showed 0 trades from V28.07, suggesting it was recently added but not yet functional.

4. WHAT WORKED

- * **Profit Factor crossed 2.0:** PF went from 1.83 to 2.03. This is a psychologically and practically significant threshold.
- * **Phantom remains rock-solid:** 170 trades, 78.2% WR, PF 1.59. This strategy is the foundation and its consistency is the reason the system works at all.
- * **Nexus and DivergenceMR activated:** Even with tiny sample sizes, these contributed \$29,812. If the edges are real and trade frequency can be increased, this alone could close the \$9,435 gap.
- * **NoiseBreakout consistency:** 52 trades with PF 1.79 and controlled DD of \$1,319. This is a reliable secondary contributor.
- * **Win rate stability:** 71.67% is strong and consistent with V28.06 (71.2%). The system is not becoming more volatile.
- * **Consecutive loss control:** Max consecutive losses = 9, with average of 2. The system recovers well from drawdowns.
- * **Risk management held:** Despite 28.14% DD, the system never blew up. The \$11,309 max DD on a \$40K+ equity peak is the system working within its parameters.

5. WHAT DIDN'T WORK

- * **11 Dead Strategies:** 61% of all strategy modules produced zero trades. This is the single biggest failure. Each dead strategy represents potential diversification and profit that is completely wasted.
- * **Drawdown exceeds limit:** 28.14% vs 24% target. The system needs to reduce peak exposure or add drawdown-circuit-breaker logic.
- * **Reaper inefficiency:** 297 trades (55% of volume) for only \$3,040 (4.6% of profit). This is an enormous resource allocation problem.
- * **Silicon-X is losing money:** PF 0.77 on 16 trades. This strategy should be disabled or fundamentally reworked.
- * **Low trade frequency:** 540 trades over 6.4 years = 84/year = 1.65/day. For a multi-strategy system with 18 modules, this is very low throughput.
- * **Wednesday trading disabled:** InpTradeWednesday=false. This eliminates ~20% of potential trading days.
- * **Chronos misconfiguration:** A M15 HFT scalper is running on H4 timeframe. This is a fundamental architecture error.

6. MATHEMATICAL PROJECTION TO \$75K

>> Current Trajectory

Net Profit = Trades x WR x AvgWin - Trades x (1-WR) x AvgLoss

$540 \times 0.7167 \times \$333.48 - 540 \times 0.2833 \times \$414.97 = \$129,077 - \$63,500 = \$65,577$

>> Path to \$75,000 (Option A: More Trades)

Additional profit needed: \$9,435

Current expectancy: \$121.42/trade

Additional trades needed at current expectancy: 78 trades

This means going from 540 to 617 total trades = 14.4% increase

>> Path to \$75,000 (Option B: Higher Expectancy)

If we keep 540 trades, expectancy must rise from \$121.42 to \$138.89/trade

That requires: 14.4% improvement in per-trade performance

>> Path to \$75,000 (Option C: Combined)

Most realistic: increase trades by 10% (to ~594) AND improve expectancy by 5% (to ~\$127.49)

Projected: $594 \times \$127.49 = \$75,729$ -- CLOSE but needs buffer

Better: 600 trades at \$130 expectancy = \$78,000 (comfortable margin)

>> Drawdown Constraint Math

Current: 28.14% max DD. Target: <24%.

The max DD of \$11,309.17 occurred on equity of ~\$40,185 at the time.

To stay under 24%: Max allowable DD = $0.24 \times \text{Peak Equity}$

At \$75,565 equity: Max DD budget = \$18,136

At \$50,000 equity: Max DD budget = \$12,000

The system needs to REDUCE absolute dollar drawdown during early growth phase.

7. CREATIVE IDEAS TO HIT \$75K

>> IDEA 1: Scale Phantom (Biggest Contributor)

Current: 170 trades, +\$26,076, PF 1.59

Phantom contributes 39.8% of all profit. If we increase its trade count by 50% (to 255 trades):

- * **Projected additional trades:** 85
- * **At current expectancy of \$153.39/trade:** +\$13,038
- * **New Phantom total:** ~\$39,114
- * **System total:** ~\$78,602 -- EXCEEDS TARGET

How: Loosen Phantom entry filters (reduce TQS threshold 0.25 to 0.20, or widen time windows)

Risk: DD from Phantom alone is already \$9,906. Scaling could push DD higher.

>> IDEA 2: Fix Reaper Protocol (55% of trades, 4.6% of profit)

Current: 297 trades, +\$3,040, PF 1.28, \$10.24/trade

Reaper is the INEFFICIENCY ENGINE. Most work for least reward.

- * **If PF improves to 1.50:** ~\$4,500 additional profit
- * **If PF improves to 1.80:** ~\$7,200 additional profit

How to fix:

- * Increase BasketTP from \$600 to \$800 (let winners run longer)
- * Reduce LotMultiplier from 1.4 to 1.3 (reduce loss amplification)
- * Reduce MaxLevels from 10 to 8 (cap maximum exposure)
- * Enable Chimera trailing earlier (TrailStart from \$200 to \$150)

>> IDEA 3: Activate Dead Strategies (11 producing 0)

If even 3 of the 11 dead strategies activate and average 20 trades each at \$100/trade:

- * **Additional:** 60 trades x \$100 = \$6,000

Priority activations:

- * **Chronos:** FIX TIMEFRAME. Move to M15 chart or disable H4 mode.
- * **Titan:** Loosen D1 EMA 50 + H4 EMA 34 alignment. These are very long periods.
- * **Warden:** Reduce BB deviation from 1.8 to 1.5 and KC ATR mult from 1.2 to 1.0
- * **SessionMomentum:** Debug why V28.07 shows 0 trades.

>> IDEA 4: Enable Wednesday Trading

Currently disabled (InpTradeWednesday=false). Wednesday = ~20% of weekdays.

- * **If Wednesday trades perform at system average:** ~108 additional trades
- * **At \$121.42 expectancy:** +\$13,113
- * This alone could exceed the \$75K target

Risk: Wednesday may have been disabled for a reason (ECB meetings). Test carefully.

>> IDEA 5: Risk Calibration Optimization

Current risk: InpBase_Risk_Percent=1.5%, InpMaxTotalRisk_Percent=12%

Dynamic scaling is already enabled. The issue is RISK DISTRIBUTION.

Proposal: Implement strategy-level risk caps:

- * **Phantom:** Max 40% of total risk allocation (dominant, let it run)
- * **Reaper:** Max 25% of total risk allocation (reduce its dominance)
- * Reserve 35% for activating dormant strategies

>> IDEA 6: Silicon-X Rework or Disable

Silicon-X is the only active LOSING strategy (-\$104.49, PF 0.77).

- * **Option A:** Disable entirely. Small loss but removes a drag.
- * **Option B:** Rework entry logic. 75% WR with PF 0.77 = avg loss >> avg win.
- * **Option C:** Reduce lot size from 0.01 to 0.005 to minimize damage.

Recommendation: Disable for V28.08. One fewer variable.

>> IDEA 7: Adaptive Strategy Weighting

Instead of equal weighting, implement a "Beehive Queen" scoring system:

- * $\text{Score} = (\text{PF} - 1.0) \times \text{Win Rate} \times \ln(\text{Trades} + 1)$
- * **Phantom score:** $0.59 \times 0.782 \times 5.14 = 2.37$
- * **Reaper score:** $0.28 \times 0.687 \times 5.70 = 1.09$
- * **NoiseBreakout score:** $0.79 \times 0.635 \times 3.95 = 1.98$

Allocate more capital to higher-scoring strategies.

>> IDEA 8: Correlation Analysis

With only 7 active strategies, there is likely trade correlation risk:

- * Phantom + Reaper may both be buying EURUSD simultaneously
- * This amplifies drawdowns during adverse moves

Implement cross-strategy correlation monitoring:

- * If >3 strategies same direction, reduce new position sizes by 50%
- * This could significantly reduce the 28.14% drawdown

8. ACTION PLAN FOR V28.08

Priority	Action	Description	Impact	Risk
HIGH	Disable Silicon-X	Remove losing strategy	+\$105	LOW
HIGH	Enable Wednesday	InpTradeWednesday=true	+\$5K-\$13K	MED
HIGH	Fix Chronos TF	Move to M15 or disable	+\$2K-\$5K	LOW
HIGH	Loosen Phantom	TQS 0.25 to 0.20	+\$5K-\$13K	MED
MED	Optimize Reaper TP	BasketTP \$600 to \$800	+\$1.5K-\$4K	LOW
MED	Reduce Reaper Lots	LotMult 1.4 to 1.3	-3% DD	LOW
MED	Loosen Warden	BB 1.8 to 1.5	+\$1K-\$3K	LOW
MED	Loosen Titan	EMA 50/34 to 30/20	+\$2K-\$5K	LOW
LOW	Correlation Cap	Max 3 same direction	-3% to -5% DD	MED
LOW	Debug SessionMom	Investigate 0 trades	+\$1K	LOW

>> V28.08 Projected Outcome (Conservative)

If we implement HIGH priority items only:

- * **Disable Silicon-X:** +\$105
- * **Enable Wednesday (conservative):** +\$5,000
- * **Fix Chronos:** +\$2,000
- * **Loosen Phantom (conservative):** +\$5,000

Conservative total: \$65,565 + \$12,105 = \$77,670 -- EXCEEDS TARGET

If we also implement MEDIUM priority:

- * **Reaper optimization:** +\$2,000
- * **Warden/Titan activation:** +\$2,000

Optimistic total: \$81,670 -- COMFORTABLY EXCEEDS TARGET

9. TIMELINE TO \$75K TARGET

>> Iteration Forecast

Version	Changes	Projected Net	Proj DD	Probability
V28.06	Baseline	\$64,209	~27%	ACTUAL
V28.07	Incremental	\$65,565	28.14%	ACTUAL
V28.08*	HIGH items	\$72K-\$78K	22-26%	70%
V28.09*	HIGH+MED	\$78K-\$85K	20-24%	60%
V28.10*	Full optimize	\$80K-\$90K	18-22%	50%

>> Realistic Assessment

The system is 1-2 iterations from hitting \$75K, PROVIDED:

- * Wednesday trading is enabled (this is the single biggest lever)
- * Phantom is scaled modestly (not aggressively)
- * Dead strategies are activated (at least 2-3 of them)
- * Reaper efficiency is improved (even marginally)

>> The Drawdown Problem

The harder problem is staying under 24% drawdown. The 28.14% DD is the real blocker.

Solutions in order of impact:

- * 1. Implement cross-strategy correlation cap (max 3 same direction)
- * 2. Reduce Reaper max levels from 10 to 8 (verify hardcap)
- * **3. Add equity-curve trading:** reduce size 50% when equity below 20-day MA
- * 4. Lower InpMaxTotalRisk_Percent from 12% to 10%

With proper drawdown management, \$75K with <24% DD is achievable in V28.08-V28.09.

FINAL VERDICT**V28.07 APOCALYPSE: STRONG SYSTEM, NEEDS TARGETED FIXES**

- * The system HAS an edge. PF 2.03 is institutional quality.
- * The system is PROFITABLE. \$65,565 on \$10K is a 655% return over 6.4 years.
- * The system is CONSISTENT. 71.67% win rate with controlled consecutive losses.
- * The system is UNDERUTILIZED. 11 of 18 strategies are dead weight.
- * The system is OVEREXPOSED. 28.14% drawdown exceeds the 24% safety limit.
- * The gap to target is CLOSEABLE. \$9,435 = 78 additional trades at current expectancy.

PRIORITY: Fix Drawdown First, Then Scale Profit

The path to \$75K is clear: enable Wednesday trading, scale Phantom, fix Chronos, activate 2-3 dead strategies, and implement correlation-based drawdown control. V28.08 should target \$75K with <24% DD. If successful, V28.09 can begin optimization toward \$100K.

*Model: Control points (crude method). Results are indicative, not definitive.
All projections assume market conditions remain within historical parameters.*
